CLIMATOLOGICAL SUMMARY OF GEORGIAN INTERNATIONAL AIRPORTS INTRODUCTION

“Climatological Summary of Georgian International Airports” is a statistical analysis of the observations data obtained by the meteorological stations at Tbilisi (UGTB), Kutaisi (UGKO), and Batumi (UGSB) international airports.

It covers a six-year period of January 2010 – December 2015. The summary is composed of two parts. The first part deals with climatological and geographic characteristics of the airports as well as circulation processes in South Caucasus, which determine the formation of weather throughout the territory of Georgia. The second part depicts the six-year distribution of meteorological elements (visibility distance along the runways, visibility, cloud height, wind speed and direction, wind Gust speed and direction, air temperature on the surface, QNH – min, max, average, correlation between air temperature, dew point temperature and relative humidity, weather phenomena) in tables and graphs according to months and seasons (some elements).

The “Climatological Summary of International Airports of Georgia” is intended for a wide range of users:

- international and domestic civil airlines which conduct flights to/from Georgian airports;
- private pilots;
- operational and administrative services of airports;
- aeronautical administration;
- air navigation services providers;
- the Georgian Civil Aviation Agency.

Besides the above-mentioned potential users, this Summary can also be used by specialists from other domains for the purposes of scientific research.

Preparation of statistical data is based on the recommendations of the International Civil Aviation Organization (ICAO) and the World Meteorological Organization (WMO) on climatologic data processing (Annex 3 to the Convention of the International Civil Aviation Organization; WMO Technical regulation № 49, Vol. 2) but at the same time the present paper contains a more detailed study and is enriched by additional information.

The depicted observation data from the meteorological stations at Tbilisi, Kutaisi and Batumi airports meet all the established requirements: the data are representative, continuous, and reliable. The Meteorological Service holds a Quality Management ISO 9001:2008 Certificate, which was issued by the “Bureau Veritas” international organization.

For obtaining climatological information of Tbilisi International Airport, thirty-minute (xx20 and xx50) METARs were processed. For Kutaisi International Airport, information was received by using one-hour METARs for the 2010-2012 period and thirty-minute (xx20 and xx50) METARs for the 2013-2015 period. Climatological data of Batumi international airport for 2010 and for the first six months of 2011 were processed on the basis of one-hour METARs, while the subsequent period on the basis of thirty-minute (xx20 and xx50) METARs.

For the three airports over 6,000 occurrences of each meteorological element were analysed. Their monthly and/or seasonal distribution is presented in the form of tables, graphs, and texts. The UTC time was used in the data processing (Tbilisi UTC +4). Abbreviations and their meaning are contained on page 593.

Meteorological elements the Summary addresses are processed according to the 8 models elaborated by WMO:

- Model A. Frequencies (per cent) of the occurrence of runway visual range/visibility (both in metres) and/or height of the base of the lowest cloud layer (in metres) of BKN or OVC extent below specified values at specified times.
- Model B. Frequencies (per cent) of visibility below specified values (in metres) at specified times.
- Model C. Frequencies (per cent) of the height of the base (in metres) of the lowest cloud layer of BKN or OVC extent below specified values at specified times.
- Model D. Frequencies of occurrence of concurrent wind direction (in 30° sectors) and speed within specified ranges.
- Model E. Frequencies (per cent) of surface temperature (screen) in specified ranges of 5°C at specified times.
- Model F. The mean pressure (QNH), the minimum and maximum pressure values calculated for each month.

- Model G. Interdependency between the relative humidity (RH), the air temperature (T_a) and the dew point temperature.
- Model H. Frequencies of occurrence of specified weather phenomena at specified times.

The Author expresses his gratitude to Sakaeronavigatsia's meteorological staff as well as to the staff of the Technical and Aeronautical Information Services of Sakaeronavigatsia for their help and contribution to the issuing of this "Summary".

Editors' board will be grateful for comments, recommendations and suggestions from users of the "Summary".

BRIEF REVIEW OF GEORGIAN CLIMATE AND CIRCULAR PROCESSES

On Georgian territory, climatic and weather conditions are characterized by big diversity. Here are represented all types of climate described in the Koppen climate classification, except the tropical and equatorial ones. This kind of climate character is determined by the location of the country in the northern part of the subtropical climatic zone and east of the Black Sea, as well as by highly irregular terrain areas with medium and high mountains, which constitute approximately 54% of the country's territory. The Caucasus Mountain range, which runs in the north of Georgia, presents its natural border and protects the country from the direct impact of arctic cold air masses. As a result, these masses move towards the country's territory from the west and, their lower layer warmed up and their humidity instability increased while passing over the Black Sea, they enter the territory saturated with moisture. Such synoptic situation is known as a **Western Circular Process**. When this synoptic process takes place the whole territory of Georgia experiences west or north-west winds, which can be strong in some areas. This process causes air temperature drop off and heavy precipitation; and after the front's passage, these conditions often continue as long as the cold air masses remain behind the front. It produces considerable cloudiness and a large amount of atmospheric precipitation, especially in West Georgia. After the air mass enters from the west, it crosses the mountain range of Likhi (Surami) – a climate barrier in Georgia – and goes down onto the wide gorge of the river Mtkvari, where a west wind blows. This process increases cloudiness and precipitation in the western part of East Georgia. In the lowland regions of the eastern part, it strengthens the west wind, whose gusts can exceed 50 knots (See Model D, Wind gust speed and direction per season). The **Western Circular Process** is typical of all seasons, but it is most frequent in spring and autumn.

The second major type of atmosphere circulation, which determines the formation of weather conditions in Georgia, is called an **Eastern Circular Process**. Like in the case of the Western Circular Process, the Caucasus Mountain range protects Georgia from cold air masses coming from the North Polar Basin and Siberia. As a result, a front approaching the north slope flows round the range from the east. A low pressure area over the Black Sea contributes to the movement of the front from east to west. Georgia experiences the so-called "Invasion from the East", in other words, spreading of relatively cold air masses from the Caspian Sea. During the development of such circular process south-east, east and north-east winds are observed in the lower layer of the atmosphere over the Georgian territory, whereas in the upper layers east winds are blowing. The Eastern Circular Process most often occurs in spring.

The Eastern Process is characterized by cloudy, rainy weather and by sharp drop of air temperature; it mainly occurs in the eastern regions of East Georgia. Usually, its strength is not enough to reach the Likhi Ridge and it dissipates on the plain of Shida Kartli. This process does not bring considerable weather changes in West Georgia. In the lower course of the River Rioni blows an east foehn wind whose speed sometimes exceeds 60 knots (See Model D, Wind gust speed and direction per season, Spring). If the process is strong, cold air masses can expand over the whole territory of Georgia, and a sharp drop in air temperature can occur on the Black Sea coast.

The only circular process that worsens weather conditions throughout Georgia and which manifests itself by the drop of air temperature on the whole territory, atmospheric precipitation and reduced visibility, is the **"Double-**

Access Invasion". This is when cold air masses accumulated to the north of the Caucasus Mountains flow round the Caucasus Ridge from the east and from the west to enter the country's territory simultaneously. After the cold air masses from the north have entered South Caucasus, an anticyclonic situation develops there. The orographic characteristics of the region, where alternation of plain and mountainous areas plays an important role, contributes to the formation of high pressure areas. During such circular process, dry and moderately cloudy weather with weak winds is observed on the whole territory of Georgia.

Upon completion of the intrusion of air masses into South Caucasus, stationary atmospheric fronts create favourable conditions for the formation of cyclones and their subsequent movement in the northeast or north direction. Such synoptic situations are called an **"Undulatory Invasion from the South"**. During this process, cyclones generate strong winds and atmospheric precipitation in the areas where they are developing and moving. During warm seasons of the year, there is a high frequency of occurrence of thunderstorm and hail. This circular process is most frequent in summer.

Due to the local physical-geographical characteristics of Tbilisi, Kutaisi and Batumi International Airports, each synoptic process determines development of different weather conditions on their territory.

The most dangerous weather phenomena for Tbilisi, Kutaisi and Batumi aerodromes are:

- Fog
- Hail
- Thunderstorm
- Strong Wind
- Heavy Precipitations

DESCRIPTION OF AERONAUTICAL CLIMATOLOGICAL MODELS

Description of the above-mentioned weather conditions developing on the territory of the aerodromes is based on the analysis of the data received in the course of meteorological observations of many years. Below are given the data processing methods corresponding to particular models.

Model A

The Climatological tables (UGTB, UGKO and UGSB) for **Model A**.

Model A contains the frequencies (per cent) of the occurrence of runway visual range/visibility (both in metres) and/or height of the base of the lowest cloud layer of BKN or OVC extent below specified values at specified times. For Kutaisi and Batumi airports, climatological data of meteorological elements were processed based on one-hour METARs, and for Tbilisi airport - based on thirty-minute METARs. The **Model A** table consists of two parts. The first part (the first 5 columns) shows frequencies (per cent) of the occurrence of runway visual range or height of the base of the lowest cloud layer of BKN or OVC extent below specified values or both. The second part (the last 4 columns) contains the frequencies (per cent) of the occurrence of visibility or height of the base of the lowest cloud layer of BKN or OVC extent below specified values or both. The values in the tables are presented on the following principle: the bigger value incorporates the smaller one(s), for example, if cloud height is less than 60m, it is included both in the column <60m and the column <90m (WMO-No. 49 - Technical Regulations, Volume II). The same principle is observed when processing the other meteorological elements in this Model.

The **Model A** table is accompanied by a graph/graphs. Such a table is made for every month of the year for each of the international airports of Georgia.

Model B

The Climatological tables (UGTB, UGKO and UGSB) for **Model B**.

Model B includes frequencies (per cent) of visibility below specified values (in metres) at specified times (See: table No. 1).

The frequency of observations implies one-hour intervals for Batumi and Kutaisi Aerodromes and half an hour intervals for Tbilisi aerodrome. The minimum (MIN) visibility values contained in the METARs were used when compiling climatological tables.

Table No.1 Visibility Criteria

<200 m	<3000 m
<600 m	<5000 m
<800 m	<8000 m
<1500 m	

To make climatological tables for this model the values of visibility observed within 24 hours were used. For each specified time the total number of observations was determined and the number of occurrences was provided in percentage based on the visibility criteria.

In the "MEAN" fields of the **Model B** table, the average value (in percentage) for each visibility criteria is given (WMO-No. 49 - Technical Regulations, Volume II). The values in the tables are presented on the following principle: the bigger value incorporates the smaller one(s), for example, if the visibility is less than 4500m, it is included both in the column <5000m and the column <8000m (WMO-No. 49 - Technical Regulations, Volume II).

A diagram was drawn for each aerodrome based on **Model B**. It reflects the dynamics of changes in visibility values according to the following gradation: <800m; <1500m; <3000m; <5000m; <8000m.

Model C

The Climatological tables (UGTB, UGKO and UGSB) for **Model C**.

Model C describes frequencies (per cent) of the height of the base of the lowest cloud layer of BKN or OVC extent below specified values at specified times (See: Table No.2).

Table No. 2. Height of the base (in feet) of the lowest cloud layer of BKN or OVC extent gradation

≤100	≤500
≤200	≤1000
≤300	≤1500

The values of the gradation are presented on the following principle: the bigger value incorporates the smaller one(s), for example, if the height of ceiling is less than 900ft, it is included both in the ≤1000ft column and in the ≤1500ft column (WMO-No. 49 - Technical Regulations, Volume II). The same principle is observed in the other columns of this Model table.

The “MEAN” fields at the bottom of the **Model C** table display the average value of the number of occurrences (in percentage) for each gradation parameter (WMO-No. 49 - Technical Regulations, Volume II).

A diagram was drawn for each aerodrome based on **Model C**. It depicts the ratio of the number of occurrences of each specified ceiling height (See: Table No. 3) to the total number of occurrences at ≤1500ft.

Table No. 3. Height of the base (in feet) of the lowest cloud layer of BKN or OVC extent gradation used in the diagram.

<100	>300≤500
>100≤200	>500≤1000
>200≤300	>1000≤1500

Model D

The Climatological tables (UGTB, UGKO and UGSB) for **Model D**.

Model D depicts frequencies of occurrence of concurrent wind direction (in 30° sectors) and speed (in knots) within specified ranges. It contains the following information:

1. Wind speed breakdown at 5 knots' intervals (for example: 1-5; 6-10; 11-15 knots etc.);
2. Wind direction breakdown according to 30° ranges (For example: 20°-40° range means wind directions of 20°-30°-40°);
3. The number of occurrences of calm conditions when the wind speed equals 0 knot;
4. The frequency of variable (VRB) winds with the following characteristics:
 - a. the wind direction is variable within 60° to 180° and the speed does not exceed 3 knots;
 - b. the wind direction is variable over 180° and the speed exceeds 3 knots.
5. Wind gusts (additional information, not required by WMO-No. 49 - Technical Regulations, Volume II).

The "TOTAL" fields of the **Model D** table show the total percentage value of the particular wind directions within particular speed ranges. Each table is accompanied by a graph.

In the table depicting wind gusts, the wind direction is given in ranges of 10° and the speed of the wind gusts over 10 knots – at 5 knots' intervals.

The tables and graphs in this Model display climatological information that was obtained during six-year observations and processed according to months and seasons.

Model E

The Climatological tables (UGTB, UGKO and UGSB) for **Model E**.

Model E describes frequencies (per cent) of surface temperature (screen) in specified ranges of 5°C at specified times.

The Tables given in the model show the monthly frequency of occurrence of specified temperatures at specified time intervals. The air temperatures of +44°C and -20°C were used as the basic highest and lowest values for processing purposes.

The table for this Model displays frequency of occurrence of the observed air temperatures within specified ranges (See: Table No. 4.) at specified time intervals. The mean values imply the monthly frequency of occurrence of each temperature range within the six-year period. The statistical analysis is provided below the table.

Table No. 4. Air temperature (°C) ranges

(°C) from	(°C) to
-20	-16
-15	-11
-10	-6
-5	-0
0	4
5	9
10	14
15	19
20	24
25	29
30	34
35	39
40	44

Model F

The Climatological tables (UGTB, UGKO and UGSB) for **Model F**.

Model F Climatological table shows the mean pressure (QNH) values at Tbilisi, Kopitnari and Batumi (UGTB, UGKO and UGSB) International Airports. The mean, the maximum and the minimum pressure values were calculated for each month of the climatological period under review.

Model G

The Climatological tables (UGTB, UGKO and UGSB) for **Model G**.

Model G Climatological table describes interdependency between the relative humidity (RH), the air temperature (Ta) and the dew point (Td) at Tbilisi, Kopitnari and Batumi (UGTB, UGKO and UGSB) International Airports for each month of the climatological period under review. In accordance with Annex 3, (Annex 3 to the Chicago Convention on International Civil Aviation, Eighteenth Edition – July 2013, APPENDIX 3. TECHNICAL SPECIFICATIONS RELATED TO METEOROLOGICAL OBSERVATIONS AND REPORTS, Chapter 4.6 Air temperature and dew-point temperature¹) the rounded values of the temperature and the dew point at 30-minute intervals were taken from regular actual weather reports (METARs). The temperature and dew point values are rounded using the following method:

Example:

1. +1.5 +1.6... +1.9°C are rounded up and included in METAR as +2°C
2. +1.1 +1.2... +1.4°C are rounded down and included in METAR as +1°C
3. -1.5 -1.4... -1.1°C are rounded up and included in METAR as -1°C
4. -1.6 -1.7... -1.9°C are rounded down and included in METAR as -2°C

The relative humidity was calculated at 30-minute intervals based on the values gained after rounding up/down, using the following formula:

$$RH = 100\% \cdot 10^{m \cdot \left\{ \frac{T_d}{T_d + T_n} + \frac{T_a}{T_a + T_n} \right\}}$$

Td – dew point temperature;

Ta (Ambient) – air temperature;

Tn – triple point temperature (constant). Triple point temperature is such a combination of the temperature and the pressure at which water may be in the gas (vapor), liquid and solid (crystal) form at the same time in the conditions of thermodynamic equilibrium.

m – constant;

Within the temperature values range of -20°C ... +50°C

Tn = 240.7263 and

m = 7,591386.

Thus, when the values of the **Tn** and **m** constants are as above the accuracy of formula based calculation of relative humidity constitutes 0.083%².

For each month of each year of the climatological period under review the mean relative humidity, mean air temperature and mean dew point values were calculated using the abovementioned method. The results are given both in the table and the trend graph.

¹ Annex 3 to the Convention on International Civil Aviation, Eighteenth Edition – July 2013

² HUMIDITY CONVERSION FORMULAS, Calculation formulas of humidity, p. 16, Vaisala 2013.

Model H

The Climatological tables (UGTB, UGKO and UGSB) for **Model H**.

Model H Climatological table shows the mean percentage of occurrences of weather phenomena at Tbilisi, Kopitnari and Batumi (UGTB, UGKO and UGSB) International Airports for each month and season of the climatological period under review. The amount of BR, RA, FOG, MIFG-VCFG, FZFG, DZ, and SN weather phenomena was calculated for each month at 30-minute intervals, on the basis of which the frequency percentage of weather phenomena occurrences was obtained (See: climatological tables).

The following criterion was used for the weather phenomena climatological tables:

if two weather phenomena are observed during the same period (00, 30), then each value is inserted separately in the corresponding column (e.g. snow (SN) and fog (FOG) go to the snow and fog columns accordingly; rain and thunderstorm (TSRA) - each value is inserted separately in the rain and thunderstorm columns, etc.).

The "RA" Column includes both weak, moderate, heavy intensity rains (Cumulus Nimbus) SHRA and rains (Nimbus stratus) RA.

Notes:

- 1 Before December 2013, METARs for Tbilisi, Kutaisi and Batumi International Airports were issued in accordance with the ICAO standards and recommendations set out in the 17th edition of ICAO Annex 3. In accordance with ICAO Annex 3, 4.3.6 Reporting, 4.3.6.3 (b), when significant meteorological conditions occur METARs shall contain the RVR maximum and minimum values. In the course of the "Summary" preparation, the minimum RVR values were only used.
- 2 According to ICAO, Annex 3 ("Meteorological Service for International Air Navigation"), Appendix 6, Article 5, Points 5.1.3 - strong surface wind and gust is counted from the speed above 30 knots.
- 3 According to ICAO, Annex 3 ("Meteorological Service for International Air Navigation"), Appendix 3, Article 4, Points 4.1.5.2 c) – "variations from the mean wind speed (gusts) during the past 10 minutes shall be reported when the maximum wind speed exceeds the mean speed by: ... 2) 5 m/s (10 kt) or more otherwise.
- 4 MIFG – SHALLOW FOG – when the vertical extension of fog on a runway is less than 2 meters.
- 5 VCFG – when fog is not observed on a runway, but exists in aerodrome zone.
- 6 "–" symbol in tables is used if there were no occurrences.

Tbilisi lies in the region where moderately warm steppe climate gradually changes into moderately subtropical. Circular processes developing in this area are typical of the subtropical and moderate climatic zones. The intruding arctic, polar and tropical air masses are connected with the Western, Eastern and Southern Circular Processes.

In the course of the atmospheric circulation process with air masses entering Georgia from the east, that is from the Caspian Sea, a relatively weak southeast wind is observed in Tbilisi. Cloudiness increases and the frequency of occurrence of low-height clouds rises (See Models B, C, D of Tbilisi (March and April)), visibility reduces, and fog is formed. These weather conditions can last for several days. During the spring and summer (see Model H, weather phenomena by season) seasons the most dangerous weather phenomena in the area of Tbilisi Airport are thunderstorms and hail. Likelihood of their formation is especially high during the “Undulatory Invasion from the South”.

In January, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 200 meters, based on six-year observation, constitutes 0.19% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 7.04% (see Model A).

In March, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 200 meters, based on six-year observation, constitutes 0.01% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 1.86% (see Model A).

In April, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 550 meters, based on six-year observation, constitutes 0.12% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.99% (see Model A).

In September, based on six-year observation the RVR (Runway Visual Range) minimum values are not observed (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.01% (see Model A).

In October, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters, based on six-year observation, constitutes 0.01% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.99% (see Model A).

In November, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 200 meters, based on six-year observation, constitutes 0.05% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 3.86% (see Model A).

In December, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 200 meters, based on six-year observation, constitutes 0.18% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Tbilisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 4.67% (see Model A).

Mean	0.85	1.93	2.56	2.89	4.66	8.37	14.93	26.54

According to the climatological table of January the mean percentage of visibility values below 8000 meters is 26.54%, correspondingly, the mean percentage of 73.46% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 200 meters is 0.85% (See climatological table of January, Model B).

According to the climatological table of March the mean percentage of visibility values below 8000 meters is 8.75%, correspondingly, the mean percentage of 91.25% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 400 meters is 0.07% (See climatological table of March, Model B).

According to the climatological table of August the mean percentage of visibility values below 8000 meters is 0.50%, correspondingly, the mean percentage of 99.50% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 3000 meters is 0.02% (See climatological table of August, Model B).

According to the climatological table of December the mean percentage of visibility values below 8000 meters is 23.68%, correspondingly, the mean percentage of 76.32% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 200 meters is 0.66% (See climatological table of December, Model B).

Mean	1.02	3.00	3.90	6.60	10.81	15.57

In January, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 30.6%
2. >500FT and <= 1000FT – 27.0%
3. >300FT and <= 500FT – 17.3%
4. >200FT and <= 300FT – 5.8%
5. >100FT and <= 200FT – 12.8%
6. <=100FT – 6.4%

In January, the mean percentage of cloud ceiling recorded above 1500 feet is 84.43% of the total amount of occurrences (See climatological table of January, Model C).

Six-year observation data on clouds revealed average occurrence probability of 1.02 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of January, Model C).

Mean	0.46	3.11	4.33	8.22	13.79	20.30

In February, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 32.1%
2. >500FT and <= 1000FT – 27.5%
3. >300FT and <= 500FT – 19.1%
4. >200FT and <= 300FT – 6.0%
5. >100FT and <= 200FT – 13.0%
6. <=100FT – 2.3%

In February, the mean percentage of cloud ceiling recorded above 1500 feet is 79.7% of the total amount of occurrences (See climatological table of February, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.46 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of February, Model C).

In March, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 42.2%
2. >500FT and <= 1000FT – 31.1%
3. >300FT and <= 500FT – 14.0%
4. >200FT and <= 300FT – 3.9%
5. >100FT and <= 200FT – 8.4%
6. <=100FT – 0.4%

In March, the mean percentage of cloud ceiling recorded above 1500 feet is 91.89% of the total amount of occurrences (See climatological table of March, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.03 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of March, Model C).

In April, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and ≤ 1500FT – 47.0%
2. >500FT and ≤ 1000FT – 30.0%
3. >300FT and ≤ 500FT – 10.6%
4. >200FT and ≤ 300FT – 3.5%
5. >100FT and ≤ 200FT – 7.1%
6. ≤ 100FT – 1.7%

In April, the mean percentage of cloud ceiling recorded above 1500 feet is 94.4% of the total amount of occurrences (See climatological table of April, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.09 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of April, Model C).

In May, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 80.1%
2. >500FT and <= 1000FT – 7.2%
3. >300FT and <= 500FT – 7.3%
4. >200FT and <= 300FT – 3.6%
5. >100FT and <= 200FT – 1.8%
6. <=100FT – not observed

In May, the mean percentage of cloud ceiling recorded above 1500 feet is 99.37% of the total amount of occurrences (See climatological table of May, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.01 percent of minimum cloud height of 200 feet and below (cloud amount BKN and OVC) (see climatological table of May, Model C).

In June, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 90.0%
2. >500FT and <= 1000FT – 10.0%
3. >300FT and <= 500FT – not observed
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In June, the mean percentage of cloud ceiling recorded above 1500 feet is 99.89% of the total amount of occurrences (See climatological table of June, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.01 percent of minimum cloud height of 1000 feet and below (cloud amount BKN and OVC) (see climatological table of June, Model C).

In July, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – not observed
2. >500FT and <= 1000FT – 100.0%
3. >300FT and <= 500FT – not observed
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In July, the mean percentage of cloud ceiling recorded above 1500 feet is 99.9% of the total amount of occurrences (See climatological table of July, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.1 percent of minimum cloud height of 1000 feet and below (cloud amount BKN and OVC) (see climatological table of July, Model C).

In August, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 76.7%
2. >500FT and <= 1000FT – 14.1%
3. >300FT and <= 500FT – 6.9%
4. >200FT and <= 300FT – 2.3%
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In August, the mean percentage of cloud ceiling recorded above 1500 feet is 99.51% of the total amount of occurrences (See climatological table of August, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.01 percent of minimum cloud height of 300 feet and below (cloud amount BKN and OVC) (see climatological table of August, Model C).

In September, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 64.2%
2. >500FT and <= 1000FT – 28.6%
3. >300FT and <= 500FT – 5.4%
4. >200FT and <= 300FT – 1.8%
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In September, the mean percentage of cloud ceiling recorded above 1500 feet is 99.34% of the total amount of occurrences (See climatological table of September, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.01 percent of minimum cloud height of 300 feet and below (cloud amount BKN and OVC) (see climatological table of September, Model C).

In October, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 52.2%
2. >500FT and <= 1000FT – 32.0%
3. >300FT and <= 500FT – 8.2%
4. >200FT and <= 300FT – 3.1%
5. >100FT and <= 200FT – 4.6%
6. <=100FT – not observed

In October, the mean percentage of cloud ceiling recorded above 1500 feet is 92.52% of the total amount of occurrences (See climatological table of October, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.34 percent of minimum cloud height of 200 feet and below (cloud amount BKN and OVC) (see climatological table of October, Model C).

In November, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 41.4%
2. >500FT and <= 1000FT – 26.0%
3. >300FT and <= 500FT – 13.9%
4. >200FT and <= 300FT – 4.8%
5. >100FT and <= 200FT – 11.3%
6. <=100FT – 2.7%

In November, the mean percentage of cloud ceiling recorded above 1500 feet is 86.73% of the total amount of occurrences (See climatological table of November, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.37 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of November, Model C).

In December, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 26.0%
2. >500FT and <= 1000FT – 24.9%
3. >300FT and <= 500FT – 17.0%
4. >200FT and <= 300FT – 7.1%
5. >100FT and <= 200FT – 18.6%
6. <=100FT – 6.4%

In December, the mean percentage of cloud ceiling recorded above 1500 feet is 91.40% of the total amount of occurrences (See climatological table of December, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.59 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of December, Model C).

UGTB Wind direction and Wind Gust speed (March, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 3.89%.

The maximum wind gust speed (61-65 knots) corresponds to Violent storm or Hurricane according to “Beaufort wind force scale” (frequency of occurrence 0.02%).

The direction of maximum wind gusts is 310°.

UGTB Wind direction and Wind Gust speed (July, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 0.50%.

The maximum wind gust speed (46-50 knots) corresponds to Strong gale or Storm according to “Beaufort wind force scale” (frequency of occurrence 0.08%).

The directions of maximum wind gusts are 310° and 320°.

UGTB Wind direction and Wind Gust speed (December, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 1.29%.

The maximum wind gust speed (51-55 knots) corresponds to Storm according to “Beaufort wind force scale” (frequency of occurrence 0.02%).

The direction of maximum wind gusts is 310°.

UGTB Wind direction and Wind Gust speed (Spring, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 2.13%.

The maximum wind speed (61-65 knots) corresponds to Violent storm and Hurricane according to “Beaufort wind force scale” (frequency of occurrence – 0.01%).

The direction of maximum wind gusts is 310°.

Absolute and Mean Atmospheric pressure (UGTB - MAX, MIN, MEAN based on 6 years observation)			
Pressure (HPA)			
Month	Max	Min	Mean
January	1039	1003	1021
February	1044	998	1020
March	1038	997	1020
April	1035	1001	1017
May	1028	1005	1016
June	1028	1001	1013
July	1024	1003	1013
August	1025	1004	1015
September	1029	1005	1018
October	1037	1006	1022
November	1040	1004	1023
December	1040	998	1024

Based on the six years observations in Tbilisi international airport (UGTB):

The Maximum absolute pressure of atmosphere - QNH detected in February - 1044 HPA;

The Minimum absolute pressure of atmosphere - QNH detected in March - 997 HPA.

BATUMI INTERNATIONAL AIRPORT (UGSB)

Batumi International Airport is located 23m (78 ft) above sea level in the southeast part of Batumi at the mouth of the river Chorokhi on its right bank in the valley known as Kakhaberi's field. There is one runway with one touchdown zone (TDZ13). The valley runs from southeast to northwest and is bounded by branches of the Adjara-Guria ridge on its right and by endings of the Shavsheti ridge on its left. These mountains adjoin the airport territory in the 180°-040° sector. To the south of the weather station flows the river Chorokhi. In its 040°-180° sector the Airport territory abuts on the Black Sea. The height of the mountains located near Batumi International Airport and their distance from the observation site are given in Table No. 5.

Table No. 5. Height and distance from the observation site of the mountains located near Batumi International Airport

Mountain	Height above sea level		Distance from the observation site m.
	m.	Ft.	
Erge	896	2939	9200
Talakhnara	760	2493	14 000
Khala	368	1207	20 000

Its location in the humid area of the subtropical zone, proximity to the Black Sea and its orographic features are specific characteristics of the climatic conditions of Batumi Airport. This territory, especially during winter, experiences moist winds, which is determined by the low pressure area in the southeast part of the Black Sea. It is known that at the Adjara shore the temperature of the sea is relatively higher (especially during winter) than at the other Black Sea shores of the Caucasus. Due to that fact, the heat transfer factor of the sea is far more noticeable here. It increases instability of air humidity and determines the abundance of atmospheric precipitation on the sea coast, which the mountain ridges located nearby contribute to. They also play an important role in the process of occlusion of Mediterranean cyclones and associated heavy precipitation, low clouds, and reduced visibility, which occur here quite often. It should also be noted, that air masses which pass over the surface of the Black Sea receive additional moisture, which in its turn strengthens the impact of the sea on the masses.

Climatological data of Batumi international airport for 2010 and for the first six months of 2011 were processed on the basis of one-hour METARs, while the subsequent period on the basis of thirty-minute (xx20 and xx50) METARs.

In January, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters and/or cloud ceiling below 100 feet, based on six-year observation, constitutes 0.07% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.22% (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 1.42% (see Model A).

In February, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters and/or cloud ceiling below 100 feet, based on six-year observation, constitutes 0.03% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 1.20% (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 3.99% (see Model A).

In March, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters and/or cloud ceiling below 100 feet, based on six-year observation, constitutes 0.02% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.67% (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 4.76% (see Model A).

In April, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 200 meters, based on six-year observation, constitutes 0.06% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 3.80% (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 8.92% (see Model A).

In October, based on six-year observation the RVR (Runway Visual Range) minimum values are not observed (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is not observed (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 0.09% (see Model A).

UGSB - Frequencies of Visibility and/or the Lowest BKN/OVC Cloud Layer Height Below Specified Values in October by Hours (2010-2015)

In December, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 1500 meters and/or cloud ceiling below 300 feet, based on six-year observation, constitutes 0.02% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.32% (see Model A).

For Batumi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 3000 meters and/or cloud ceiling below 1000 feet is 1.20% (see Model A).

UGSB - Frequencies of RVR and/or the Lowest BKN/OVC Cloud Layer Height Below Specified Values in December by Hours (2010-2015)

Mean	0.05	0.65	1.54	1.77	2.27	3.56	5.35	13.60

According to the climatological table of April the mean percentage of visibility values below 8000 meters is 13.60%; correspondingly, the mean percentage of 86.40% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 200 meters is 0.05% (See climatological table of April, Model B).

Mean	-	-	0.02	0.09	0.27	0.66	1.81	15.20

According to the climatological table of December the mean percentage of visibility values below 8000 meters is 15.20%; correspondingly, the mean percentage of 84.80% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 600 meters is 0.02% (See climatological table of December, Model B).

In January, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 70.1%
2. >500FT and <= 1000FT – 26.9%
3. >300FT and <= 500FT – 1.9%
4. >200FT and <= 300FT – 1.1%
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In January, the mean percentage of cloud ceiling recorded above 1500 feet is 92.07% of the total amount of occurrences (See climatological table of January, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.09 percent of minimum cloud height of 300 feet and below (cloud amount BKN and OVC) (see climatological table of January, Model C).

In February, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 53.9%
2. >500FT and <= 1000FT – 32.4%
3. >300FT and <= 500FT – 6.7%
4. >200FT and <= 300FT – 1.9%
5. >100FT and <= 200FT – 2.4%
6. <=100FT – 2.8%

In February, the mean percentage of cloud ceiling recorded above 1500 feet is 87.5% of the total amount of occurrences (See climatological table of February, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.35 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of February, Model C).

In March, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 51.0%
2. >500FT and <= 1000FT – 39.4%
3. >300FT and <= 500FT – 8.2%
4. >200FT and <= 300FT – 0.6%
5. >100FT and <= 200FT – 0.6%
6. <=100FT – 0.2%

In March, the mean percentage of cloud ceiling recorded above 1500 feet is 86.47% of the total amount of occurrences (See climatological table of March, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.03 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of March, Model C).

In April, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 34.2%
2. >500FT and <= 1000FT – 35.9%
3. >300FT and <= 500FT – 10.5%
4. >200FT and <= 300FT – 5.1%
5. >100FT and <= 200FT – 5.2%
6. <=100FT – 9.1%

In April, the mean percentage of cloud ceiling recorded above 1500 feet is 86.91% of the total amount of occurrences (See climatological table of April, Model C).

Six-year observation data on clouds revealed average occurrence probability of 1.2 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of April, Model C).

In June, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 55.8%
2. >500FT and <= 1000FT – 38.1%
3. >300FT and <= 500FT – 6.1%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In June, the mean percentage of cloud ceiling recorded above 1500 feet is 97.55% of the total amount of occurrences (See climatological table of June, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.15 percent of minimum cloud height of 500 feet and below (cloud amount BKN and OVC) (see climatological table of June, Model C).

UGSB - Mean Cloud Base (July 2010-2015)

In July, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 79.6%
2. >500FT and <= 1000FT – 18.2%
3. >300FT and <= 500FT – 2.2%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In July, the mean percentage of cloud ceiling recorded above 1500 feet is 98.96% of the total amount of occurrences (See climatological table of July, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.02 percent of minimum cloud height of 500 feet and below (cloud amount BKN and OVC) (see climatological table of July, Model C).

UGSB - Mean Cloud Base (August 2010-2015)

In August, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 63.0%
2. >500FT and <= 1000FT – 34.8%
3. >300FT and <= 500FT – 2.2%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In August, the mean percentage of cloud ceiling recorded above 1500 feet is 98.92% of the total amount of occurrences (See climatological table of August, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.02 percent of minimum cloud height of 500 feet and below (cloud amount BKN and OVC) (see climatological table of August, Model C).

In September, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 76.9%
2. >500FT and <= 1000FT – 21.4%
3. >300FT and <= 500FT – 1.7%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In September, the mean percentage of cloud ceiling recorded above 1500 feet is 98.42% of the total amount of occurrences (See climatological table of September, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.03 percent of minimum cloud height of 500 feet and below (cloud amount BKN and OVC) (see climatological table of September, Model C).

1.76%

The prevailing wind directions of 110°-160° frequency of occurrence is 65.89%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze (frequency of occurrence 43.60%) and wind speed of 11-20 knots, which is the Moderate and Fresh breeze (frequency of occurrence 43.26%) according to "Beaufort wind force scale".

The maximum wind of 31-35 knots is observed within the 110°-130° and 290°-310° sectors (frequency of occurrence 0.14%).

The prevailing wind directions of 110°-160° frequency of occurrence is 54.66%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze according to "Beaufort wind force scale" (frequency of occurrence 74.94%).

The maximum wind of 31-35 knots is observed within the 200°-220° sector (frequency of occurrence 0.03%).

UGSB Wind direction and Wind Gust speed (March, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 0.15%.

The maximum wind speed (46-50 knots) corresponds to the Strong gale and Storm according to “Beaufort wind force scale” (frequency of occurrence – 0.01%).

The direction of maximum wind gusts is 220°.

UGSB Wind direction and Wind Gust speed (September, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 0.01%.

The maximum wind speed (41-45 knots) corresponds to the Strong gale according to “Beaufort wind force scale” (frequency of occurrence – 0.01%).

The direction of maximum wind gusts is 220°.

UGSB Wind direction and Wind Gust speed (December, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 0.42%.

The maximum wind speed (46-50 knots) corresponds to the Strong gale and Storm according to “Beaufort wind force scale” (frequency of occurrence – 0.01%).

The direction of maximum wind gusts is 260°.

The prevailing wind directions of 110°-160° frequency of occurrence is 29.04% and that of 200°-250° directions is 25.93%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze according to "Beaufort wind force scale" (frequency of occurrence 71.46%).

The maximum wind of 36-40 knots is observed within the 110°-130° sector (frequency of occurrence 0.004%).

UGSB Wind direction and Wind Gust speed (Autumn, 2010-2015)

The strong wind (wind gust ≥ 41 knots) frequency of occurrence – 0.02%.

The maximum wind speed (41-45 knots) corresponds to the Strong gale according to “Beaufort wind force scale” (frequency of occurrence – 0.02%).

The directions of maximum wind gusts are 220°, 230° and 260°.

Absolute and Mean Atmospheric pressure (UGSB - MAX, MIN, MEAN based on 6 years observation)			
Pressure (HPA)			
Month	Max	Min	Mean
January	1037	997	1019
February	1040	994	1018
March	1037	991	1020
April	1031	996	1017
May	1025	1001	1015
June	1023	997	1013
July	1022	1002	1012
August	1021	1001	1013
September	1027	997	1015
October	1035	1000	1019
November	1037	1007	1021
December	1039	990	1022

Based on the six years observations in Batumi international airport (UGSB):

The Maximum absolute pressure of atmosphere - QNH detected in February - 1040 HPA;

The Minimum absolute pressure of atmosphere - QNH detected in December - 990 HPA.

KUTAIISI INTERNATIONAL AIRPORT (UGKO)

The elevation of David Agmashenebeli Kutaisi International Airport is 48m (160ft) above sea level. There is one runway with two touchdown zones (TDZ07/25). It is located on the right bank of the river Rioni, approximately 20 km from Kutaisi. The airport territory is surrounded by high mountain ranges, whose height and distance from the observation site is given in Table No. 6.

Table No. 6. Height of the mountains located near Kutaisi International Airport and their distance from the observation site.

Mountain	Height Above Sea Level		Distance from the observation site m
	m	ft	
Askhi	2520	8267	25 388
Khvamli	2001	6564	30 109
Gomi	2121	6958	19 862

This territory is located in the moderately humid subtropical zone. This fact, along with its geographical location, determines the climatic conditions of the area. They are characterized by moderately warm winters and relatively dry and hot summers. West and east winds prevail in Kutaisi. This is mostly due to its location on the Kolkheti Lowland, which permits cold air masses to move easily into the area both from the west (i.e. from the Black Sea) and from the east (i.e. from the Caspian Sea). The river Rioni gorge in its Kutaisi section is characterized by foehn-type winds, which significantly determines the temperature regime of the area. Due to this fact, air temperature at Kutaisi Airport is relatively higher than at other airports of Georgia (See Model E, page 523). Here, the frequency of east winds and their intensity are quite high. Such weather conditions are experienced when easterly circular processes are taking place in South Caucasus.

In the vicinity of Kutaisi Airport weather conditions most difficult for flight operations occur during the process of “westerly invasion”. If the process is strong, it generates a difficult meteorological situation with strong west winds (See Model D, page 513), low height of the base of the lowest cloud layer and reduced visibility; thunderstorms develop, accompanied by shower precipitation. Foggy days are frequent during the winter. Such adverse weather conditions do not last for long. After strong invasions have finished, anti-cyclone type weather is formed.

For Kutaisi International Airport, information was received by using one-hour METARs for the 2010-2012 period and thirty-minute (xx20 and xx50) METARs for the 2013-2015 period.

In January, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters and/or cloud ceiling below 100 feet, based on six-year observation, constitutes 0.12% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Kutaisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.58% (see Model A).

In February, based on six-year observation the RVR (Runway Visual Range) minimum values are not observed (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Kutaisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.26% (see Model A).

In June, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 350 meters and/or cloud ceiling below 100 feet, based on six-year observation, constitutes 0.07% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Kutaisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.24% (see Model A).

TOTAL	-	-	-	-	0.04	0.02	0.18	1.77	12.96

In December, the observed occurrence of the RVR (Runway Visual Range) minimum values of below 1500 meters and/or cloud ceiling below 300 feet, based on six-year observation, constitutes 0.04% (see Model A).

According to the rules established in aviation meteorology, the RVR should be defined whenever horizontal visibility is less than 1500 meters.

For Kutaisi International Airport, based on six-year observation, the occurrence frequency of horizontal visibility below 1500 meters and/or cloud ceiling below 500 feet is 0.18% (see Model A).

UGKO - Frequencies of RVR and/or the Lowest BKN/OVC Cloud Layer Height Below Specified Values in December by Hours (2010-2015)

UGKO - Frequencies of Visibility and/or the Lowest BKN/OVC Cloud Layer Height Below Specified Values in December by Hours (2010-2015)

According to the climatological table of July the mean percentage of visibility values below 8000 meters is 5.58%, correspondingly, the mean percentage of 94.42% constitutes the visibility values of 8000 meters or above.

According to the climatological table, based on the statistical analysis, the occurrence probability of horizontal visibility values below 200 meters is 0.02% (See climatological table of July, Model B).

Mean	0.03	0.15	0.32	0.34	0.68	1.58

In January, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 56.8%
2. >500FT and <= 1000FT – 21.4%
3. >300FT and <= 500FT – 1.4%
4. >200FT and <= 300FT – 10.2%
5. >100FT and <= 200FT – 8.0%
6. <=100FT – 2.1%

In January, the mean percentage of cloud ceiling recorded above 1500 feet is 98.42% of the total amount of occurrences (See climatological table of January, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.03 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of January, Model C).

UGKO - Mean Cloud Base (February 2010-2015)

In February, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 77.0%
2. >500FT and <= 1000FT – 23.0%
3. >300FT and <= 500FT – not observed
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In February, the mean percentage of cloud ceiling recorded above 1500 feet is 97.12% of the total amount of occurrences (See climatological table of February, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.66 percent of minimum cloud height of 1000 feet and below (cloud amount BKN and OVC) (see climatological table of February, Model C).

In March, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 51.4%
2. >500FT and <= 1000FT – 23.1%
3. >300FT and <= 500FT – 5.0%
4. >200FT and <= 300FT – 13.1%
5. >100FT and <= 200FT – 6.3%
6. <=100FT – 1.2%

In March, the mean percentage of cloud ceiling recorded above 1500 feet is 97.73% of the total amount of occurrences (See climatological table of March, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.03 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of March, Model C).

In April, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 71.4%
2. >500FT and <= 1000FT – 8.1%
3. >300FT and <= 500FT – 3.6%
4. >200FT and <= 300FT – 9.4%
5. >100FT and <= 200FT – 7.5%
6. <=100FT – not observed

In April, the mean percentage of cloud ceiling recorded above 1500 feet is 98.71% of the total amount of occurrences (See climatological table of April, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.10 percent of minimum cloud height of 200 feet and below (cloud amount BKN and OVC) (see climatological table of April, Model C).

In October, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 33.3%
2. >500 FT and <= 1000FT – 54.1%
3. >300FT and <= 500FT – 8.3%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – 4.2%

In October, the mean percentage of cloud ceiling recorded above 1500 feet is 99.46% of the total amount of occurrences (See climatological table of October, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.02 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of October, Model C).

In November, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 47.6%
2. >500 FT and <= 1000FT – 23.9%
3. >300FT and <= 500FT – 19.1%
4. >200FT and <= 300FT – 4.7%
5. >100FT and <= 200FT – 4.8%
6. <=100FT – not observed

In November, the mean percentage of cloud ceiling recorded above 1500 feet is 99.51% of the total amount of occurrences (See climatological table of November, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.02 percent of minimum cloud height of 100 feet and below (cloud amount BKN and OVC) (see climatological table of November, Model C).

In December, the percentage of the observed occurrences of clouds (BKN or OVC extents only) at the specified heights, below 1500 feet is as follows:

1. >1000FT and <= 1500FT – 72.8%
2. >500 FT and <= 1000FT – 25.4%
3. >300FT and <= 500FT – 1.8%
4. >200FT and <= 300FT – not observed
5. >100FT and <= 200FT – not observed
6. <=100FT – not observed

In December, the mean percentage of cloud ceiling recorded above 1500 feet is 98.79% of the total amount of occurrences (See climatological table of December, Model C).

Six-year observation data on clouds revealed average occurrence probability of 0.02 percent of minimum cloud height of 500 feet and below (cloud amount BKN and OVC) (see climatological table of December, Model C).

CALM
5.20%

VARIABLE
7.56%

The prevailing wind directions of 080°-100° frequency of occurrence is 44.93%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze according to "Beaufort wind force scale" (frequency of occurrence 65.01%).

The maximum wind of 46-50 knots is observed within the 080°-100° sector (frequency of occurrence 0.09%).

The strong wind (wind gust ≥ 41 knots) (frequency of occurrence – 0.73%).

The maximum wind speed (46-50 knots) corresponds to the Strong gale and Storm according to “Beaufort wind force scale” (frequency of occurrence – 0.11%).

The directions of maximum wind gusts are 070°, 080° and 090°.

UGKO Wind direction and Wind Gust speed (October, 2010-2015)

The strong wind (wind gust ≥ 41 knots) (frequency of occurrence – 1.27%).

The maximum wind speed (51-55 knots) corresponds to the Storm according to “Beaufort wind force scale” (frequency of occurrence – 0.08%).

The directions of maximum wind gusts are 070° and 090°.

The prevailing wind directions of 080°-100° frequency of occurrence is 47.10%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze according to "Beaufort wind force scale" (frequency of occurrence 58.60%).

The maximum wind of >50 knots is observed within the 080°-100° sector (frequency of occurrence 0.34%).

VARIABLE
13.18%

The prevailing wind directions of 260°-280° frequency of occurrence is 26.16%.

The most frequent wind speed is up to 10 knots, which is the Light and Gentle breeze according to "Beaufort wind force scale" (frequency of occurrence 68.34%).

The maximum wind of 41-45 knots is observed within the 080°-100° sector (frequency of occurrence 0.05%).

UGKO Wind direction and Wind Gust speed (Winter, 2010-2015)

The strong wind (wind gust ≥ 41 knots) (frequency of occurrence – 4.4%).

The maximum wind speed (56-60 knots) corresponds to the Violent storm according to “Beaufort wind force scale” (frequency of occurrence – 0.14%).

The directions of maximum wind gusts are 070°, 080° and 090°.

UGKO Wind direction and Wind Gust speed (Autumn, 2010-2015)

The strong wind (wind gust ≥ 41 knots) (frequency of occurrence – 1.53%).

The maximum wind speed (61-65 knots) corresponds to the Violent Storm and Hurricane according to “Beaufort wind force scale” (frequency of occurrence – 0.01%).

The direction of maximum wind gusts is 070°.

UGKO - Temperature (December 2010-2015)

ABSOLUTE AND MEAN ATMOSPHERIC PRESSURE

AERONAUTICAL CLIMATOLOGY

AERODROME CLIMATOLOGICAL SUMMARY TABULAR FORM

MODEL F

AERODROME: UGKO

MONTHLY

PERIOD OF RECORD: 2010-2015

TOTAL NUMBER OF OBSERVATIONS: 78864

OBSERVATION INTERVAL: 30 MIN.

LATITUDE: 421036.57N

LONGITUDE: 0422857.77E

ELEVATION ABOVE MSL: 160 FT

Absolute and Mean Atmospheric pressure (UGKO - MAX, MIN, MEAN based on 6 years observation)			
Pressure (HPA)			
Month	Max	Min	Mean
January	1037	997	1019
February	1040	997	1018
March	1038	997	1019
April	1035	995	1016
May	1024	1001	1013
June	1022	996	1012
July	1021	1000	1010
August	1020	1000	1011
September	1027	999	1014
October	1030	1001	1016
November	1036	1004	1020
December	1038	996	1021

Based on the six years observations in Kutaisi international airport (UGKO):

The Maximum absolute pressure of atmosphere - QNH detected in February - 1040 HPA;

The Minimum absolute pressure of atmosphere - QNH detected in April - 995 HPA.
